

How to Set Up a

Dal Mill

Split Pulses

(Roasted Gram Split, Dal & Chana)

“ Profitable Food Processing Business Idea ”

INTRODUCTION

Split Pulses (commonly known as Dal) are made from whole pulses that have been de-skinned and oiled for ease of cooking and longer shelf life. Chana (Gram), Mung, Massor, Urad, and Arhar (Tur) are commonly processed pulses that are an important part of the staple diet in all Indian states. Both vegetarians and non-vegetarians in India depend on pulse splits, also known as 'dal.'

Split pulses are one of the most important sources of protein in Indian cuisine. Chana (Gram), Mung, Masoor, Urad, and Tur (Arhar) dal are the most popular varieties. Chana (Gram) Masoor and Mung dal are the most common in the North, Central, and Eastern parts of India. In Western and Central India, chana, arhar, and mung dal are common, while Urad, arhar, and mung dal are popular in Southern India.

USES OF PULSES

Pulses are an integral part of a safe, balanced diet and have been shown to help prevent diseases like cancer, diabetes, and heart disease.

- Pulses are a low-fat protein source with a lot of fibre and a low glycemic index.**
- Pulses contain a lot of fibre, both soluble and insoluble fibres. Insoluble fibre aids digestion and regularity, while soluble fibre lowers blood cholesterol and controls blood sugar levels.**

- **Pulses are a good source of vitamins and minerals. Iron, potassium, magnesium, and zinc are just a few of the important minerals found in pulses. B vitamins, such as folate, thiamin, and niacin, are especially abundant in pulses.**
- **Pulses usually contain about twice the protein contained in whole grain cereals such as wheat, oats, barley, and rice, and are the primary source of protein for most people in developing countries.**

- **Pulses can help reduce blood cholesterol and blood glucose levels, both of which are important factors in preventing diabetes and cardiovascular disease. Eating pulses as a substitute for certain animal protein helps to reduce saturated fat consumption while increasing fibre intake.**
- **Pulses' nutritional qualities make them especially useful in the battle against certain non-communicable diseases, in addition to contributing to a stable, balanced diet.**

According to the World Health Organization, risk factors such as unhealthy diets and encouraging improved eating habits, which include pulses, could prevent up to 80% of cardiac disease, stroke, and type 2 diabetes, as well as over a third of cancers.

DEMAND OF PULSES

Pulses, when combined with cereals, offer an ideal combination of vegetarian protein with high biological value. India is the world's largest producer, importer, and buyer of pulses, accounting for 25% of global production from a total of 35% of the world's land area covered by pulses. Because pulses are primarily grown under rainfed conditions in India in areas with high rainfall variability,...

India's pulse productivity is less than half that of the United States and Canada. The persistent and rising demand–supply gap is putting pressure on prices and this good source of vegetarian protein is turning inaccessible to the poor. Pulse production in India has become engulfed in a vicious cycle of low and unpredictable yields, weak per hectare returns, and farmers' aversion to growing pulses on irrigated and fertile land, resulting in unstable and low yields.

Inadequate adoption of production technologies, increased market volatility, production risk, and a lack of irrigation are all major influencing factors in the stagnation of these crops' productivity. By 2050, the country would need 39 million tonnes of total pulses, implying a 2.2 percent annual growth rate in pulse output. To meet the rising demand, the country must generate enough pulses while remaining competitive enough to protect domestic supply.

To encourage farmers to plant more pulses, it is critical to develop and adopt more efficient crop-production technologies, as well as favourable policies and market support. Making pulses affordable by increasing domestic production is the best option for providing nutritional protection to the poor masses who follow a vegetarian diet.

In order to increase the supply of pulses to the poor, the current scenario calls for distribution through the public distribution system, which will not only provide pulses to the poor at affordable prices and improve nutritional protection, but also stabilize prices and give farmers a boost through assured procurement. One of the major reasons for pulses' poor performance is a lack of a stable market.

Growers will receive sufficient marketing support from government procurement. It is essential to encourage alternative marketing arrangements such as contract farming and the farmer producer company model.

MILLING PROCESS

Cleaning, grading, pitting, treatment milling, and polishing operations are all part of the milling process. Milling processes are usually defined for the most difficult to mill pulse grains, such as pigeon pea. The following are the main steps involved in pulse milling:

Grading and cleaning: It entails extracting dust, soil, foreign material, off-sized, young, and damaged grains, as well as grading them into two or more fractions for separate processing.

Pitting: In commercial dal mills, emery-coated rollers are commonly used. The emery coating has abrasive and refractory properties. During pre-milling treatment, whole pulses are passed through an abrasive roller machine to scrape the seed and allow oil/water.

Treatments applied prior to milling:

Pre-milling treatment is used to loosen the husk from the cotyledons, which is bound to the cotyledons via a gum sheet. Pigeonpea is the most common crop for which pre-treatments have been produced. Pre-milling treatments such as water soaking, oil and water application, sodium bicarbonate solution mixing, and thermal applications are commonly recommended and used.

Oil and water treatment is commonly used for commercial milling in large capacity dal mills, whereas water treatment is commonly used for household milling. Depending on the form of grain, various approaches are used in different regions. This ranges from mill to mill as well. Pre-treatments are divided into two categories: wet treatment and dry treatment.

Treatment with water:

Soaking and drying are considered useful techniques for loosening the husk in this form of treatment. This approach allows for easier dehusking and splitting of the cotyledons, resulting in less breakage. This is due to a lower percentage of grains being deshusked during the water treatment process. It does, however, have the drawbacks of being weather-dependent and labor-intensive.

This method produces a better-cooking dal, but it takes longer to prepare. The most widely used red earth treatment is classified as a wet procedure. After soaking in water for about 12 hours and heaping for about 16 hours, grains are thoroughly mixed with a red earth paste. For 2–4 days, the grains are spread out in a thin layer in drying yards. When dried, the red earth is separated by sieving and the grains are then milled on power operated stone or emery coated vertical chakki to yield dal.

Dry care:

Dry milling is said to produce dal that cooks faster, but there are significant losses due to broken and powdered dal. The application of oil/water followed by drying are essential steps in the dry method of pulse processing.

MARKET OUTLOOK

Pulses are consumed around 2.8 kg per person per year in India. Pulse consumption is higher in the north, east, and central parts of India. Split pulse consumption is lower in Western and Southern India, as there is also Wheat and Rice, as well as Green vegetables, as a major part of the staple diet.

Pulses and split pulses use has also been harmed as a result of inconsistencies in production, high import/processing costs, and the use of substitute goods. With a national average of 2.8 kg per year and a population of 130.0 million people, the projected demand for pulses and split pulses is around 37.07 million metric tonnes per year.

According to a conservative estimate, there is a demand of approximately 25.0 Lac MT per year, of which nearly 60% is met by domestic crop and 40% is met by imports of pulses from various countries. Between 2015 and 2020, the global pulses market grew at a moderate pace. Because of their high amounts of dietary fibre, vitamins, minerals, phytochemicals, and complex carbohydrates, pulses are considered a superfood. Pulses help with digestion,...

...blood glucose control, inflammation reduction, blood cholesterol reduction, and the prevention of chronic diseases like diabetes, heart disease, and obesity, among other things. However, depending on dietary habits, availability, and prevailing circumstances, their intake varies from region to region. The global pulses market is expected to hit 148.5 million tonnes by 2026, according to the publisher, indicating moderate growth during the forecast period (2021-2026).

Reasons for Buying our Report:

- **This report helps you to identify a profitable project for investing or diversifying into by throwing light to crucial areas like industry size, market potential of the product and reasons for investing in the product**
- **This report provides vital information on the product like it's characteristics and segmentation**
- **This report helps you market and place the product correctly by identifying the target customer group of the product**

- **This report helps you understand the viability of the project by disclosing details like machinery required, project costs and snapshot of other project financials**
- **The report provides a glimpse of government regulations applicable on the industry**
- **The report provides forecasts of key parameters which helps to anticipate the industry performance and make sound business decisions**

OUR APPROACH

- **Our research reports broadly cover Indian markets, present analysis, outlook and forecast for a period of five years.**
- **The market forecasts are developed on the basis of secondary research and are cross-validated through interactions with the industry players**
- **We use reliable sources of information and databases. And information from such sources is processed by us and included in the report**

Scope of the Report

The report titled “Market Survey cum Detailed Techno Economic Feasibility Report on Dal Mill (Roasted Gram Split, Dal & Chana).” provides an insight into Dal Mill (Roasted Gram Split, Dal & Chana) market in India with focus on uses and applications, Manufacturing Process, Process Flow Sheets, Plant Layout and Project Financials of Dal Mill (Roasted Gram Split, Dal & Chana) project. The report assesses the market sizing and growth of the Indian Dal Mill (Roasted Gram Split, Dal & Chana) Industry. While expanding a current business or while venturing into new business, entrepreneurs are often faced with the dilemma of zeroing in on a suitable product/line. And before diversifying/venturing into any product, they wish to study the following aspects of the identified product:

- **Good Present/Future Demand**
- **Export-Import Market Potential**
- **Raw Material & Manpower Availability**
- **Project Costs and Payback Period**

We at NPCS, through our reliable expertise in the project consultancy and market research field, have demystified the situation by putting forward the emerging business opportunity in the Dal Mill (Roasted Gram Split, Dal & Chana) sector in India along with its business prospects. Through this report we have identified Dal Mill (Roasted Gram Split, Dal & Chana) project as a lucrative investment avenue.

The background of the slide is a dark blue space-themed image. It features a large orange ring in the top left corner, resembling a planet or a ringed planet. Scattered throughout the dark blue field are various colorful geometric shapes, including triangles, circles, and lines, in shades of red, purple, yellow, and white, giving the impression of stars or distant galaxies.
